KSL
VARIABLE FILL FLUID COUPLINGS
INTRODUCTION

Transfluid designed the KSL series variable fill fluid coupling to overcome difficulties experienced during ‘start up’ and ‘speed variation’ operation for medium or high powered machines, driven by electric motors or internal combustion engines.

WORKING OPERATION

Extremely efficient performance is achieved utilizing the KSL’s very simple and effective principle. Oil, as the power medium, is pumped from a sump to the hydrodynamic coupling circuit, where it is finally ‘drained-off’ through a series of orifice plugs, back into the sump.

The variable fill principle:
By controlling the oil flow to the working circuit through a frequency converter, changes occur inside the coupling’s working circuit which alter the coupling’s slip characteristics dramatically softening the ‘start up’.

Torque limiting function:
Having all the same advantages of fluid couplings, variable fill-drain type fluid couplings build up torque gradually.

Disconnect:
Interrupting the oil flow into the coupling empties the working circuit and disconnects the input from the output. This disconnection can be accelerated by using the quick release valves.

In summary, it is possible to:
• have a long start up acceleration, up to several minutes, for high inertia machines.
• position the driven machine for loading, unloading and maintenance.
• obtain sequential starting for more than one drive motor.
• adjust or limit the torque.
• disconnect the load even with the motor running.
• use for conveyors, for the reduction of the tension to a minimum level or the possibility of running at an inspection speed.
• vary the speed within a 5:1 range for centrifugal machines.

CHARACTERISTICS

Soft starter
The KSL working circuit is gradually filled by oil from an empty condition to a fully filled one. Such behaviour provides an extremely soft controlled start up, especially with high inertia machinery. The KSL variable oil feed system is controlled by a frequency converter during the ramp up, producing ideal soft starting.

Accurate speed variation
By remote signal, the KSL always guarantees output speed accuracy, as required by the operator or control system. Speed variation is also possible by manual flow control valve operation.

A frequency converter electronic bypass is supplied standard.

Vibration Dampening
One of the most important characteristics of KSL fluid coupling is its torsional vibration dampening effect, protecting both the driven gear box, fan, or pump machinery, as well as the motor or engine.

Overload Protection
This is a fluid coupling advantage and a big benefit to users. Even more protection can be achieved by installing “quick release valves” which discharge oil from the working circuit in few seconds, limiting prolonged overloads completely.

High Efficiency
The KSL is an extremely efficient device compared to the constant filled type fluid coupling, because the working circuit volume is controlled at the fullest possible level to maintain a very small slip rate.

Shaft Labyrinth Sealing
This type of seal helps the KSL series to be a low maintenance machine.

Ease of Maintenance
Thanks to its split casing design, it is possible to remove the complete fluid coupling impeller assembly without having to move either the motor/engine or driven machinery, saving the need for realignment and costly down time.

Optional
Auxiliary Lubrication unit for prime mover and/or driven machine bearing.

ATEX EEx
Upon request.

APPLICATIONS

Mills, crushers, conveyors, fans, blowers, pumps, compressors, centrifuges, mixers, generators, marine propulsion drives.

SELECTION

To correctly select the KSL, Transfluid needs to know the following data:
• motor/engine type, power and speed
• driven machinery type, power, speed and inertia
• output speed range
• environmental conditions
• cooling water/air characteristics
• drive and driven shaft dimensions and tolerances
• available voltage for motors and instruments

Variable fill fluid couplings - 1403
WORKING SCHEME

AUTOMATIC or SEMIAUTOMATIC / MANUAL or MANUAL

All parameters under control such as:
- speed
- start up modulation
- oil pressure
- oil temperature
- filter clogging
- oil level
- heat exchanger pump thermostatic control.

**CONTROL PANEL**

- Display speed, speed settings (4-20 mA) and O/Cs
- Input signals from sensors and switches
- Output signals to DCS
- Local Speed Setting
- Local/Remote
- Automatic or Semiautomatic / Manual or Manual

**Variable Flow Feed Pump with Variable Frequency Converter**

1. Variable flow feed pump with variable frequency converter
2. Lubrication oil pump
3. Heat exchanger oil pump
4. Pressure gauge
5. Pressure differential transducer
6. Bleeding orifices
7. Quick release valves
8. Heat exchanger
9. Oil level switch and gauge

10. Max temperature switch
11. Feed oil filter
12. Lub. oil filter
13. Vacuum switch
14. Pressure gauge
15. Temperature gauge
16. Thermocouple Pt100
17. Speed sensors
18. Heat exch. pump control
19. Manual flow control valve

**Main Drive Motor**

**Gear Box**

**Driven Machine**

* With steel impellers.

NOTE: Standard squirrel cage motors should NOT be derated.
Efficiency of electric motor is NOT affected by KSL application.
Value of electric motor efficiency can be found in manufacturer’s catalogue.
Slip can vary ±10% according to driven machine characteristics.
